Networks of Nations Zeev Maoz,2010-12-06 Maoz views the evolution of international relations over the last two centuries as a set of interacting, cooperative and conflicting networks of states. The networks that emerged are the result of national choice processes about forming or breaking ties with other states. States are constantly concerned with their security and survival in an anarchic world. Their security concerns stem from their external environment and their past conflicts. Because many of them cannot ensure their security by their own power, they need allies to balance against a hostile international environment. The alliance choices made by states define the structure of security cooperation networks and spill over into other cooperative networks, including trade and institutions. Maoz tests his theory by applying social networks analysis (SNA) methods to international relations. He offers a novel perspective as a system of interrelated networks that co-evolve and interact with one another.

Towards a Collaborative Memory Sara Jones,2022-08-12 Focusing on the memory of the German Democratic Republic, Towards a Collaborative Memory explores the cross-border collaborations of three German institutions. Using an innovative theoretical and methodological framework, drawing on relational sociology, network analysis and narrative, the study highlights the epistemic coloniality that has underpinned global partnerships across European actors and institutions. Sara Jones reconceptualizes transnational memory towards an approach that is collaborative not only in its practices, but also in its ethics, and shows how these institutions position themselves within dominant relationship cultures reflected between East and West, and North and South.

Feature Engineering for Machine Learning and Data Analytics Guozhu Dong,Huan Liu,2018-03-14 Feature engineering plays a vital role in big data analytics. Machine learning and data mining algorithms cannot work without data. Little can be achieved if there are few features to represent the underlying data objects, and the quality of results of those algorithms largely depends on the quality of the available features. Feature Engineering for Machine Learning and Data Analytics provides a comprehensive introduction to feature engineering, including feature generation, feature extraction, feature

transformation, feature selection, and feature analysis and evaluation. The book presents key concepts, methods, examples, and applications, as well as chapters on feature engineering for major data types such as texts, images, sequences, time series, graphs, streaming data, software engineering data, Twitter data, and social media data. It also contains generic feature generation approaches, as well as methods for generating tried-and-tested, hand-crafted, domain-specific features. The first chapter defines the concepts of features and feature engineering, offers an overview of the book, and provides pointers to topics not covered in this book. The next six chapters are devoted to feature engineering, including feature generation for specific data types. The subsequent four chapters cover generic approaches for feature engineering, namely feature selection, feature transformation based feature engineering, deep learning based feature engineering, and pattern based feature generation and engineering. The last three chapters discuss feature engineering for social bot detection, software management, and Twitter-based applications respectively. This book can be used as a reference for data analysts, big data scientists, data preprocessing workers, project managers, project developers, prediction modelers, professors, researchers, graduate students, and upper level undergraduate students. It can also be used as the primary text for courses on feature engineering, or as a supplement for courses on machine learning, data mining, and big data analytics.

The coverage spans key concepts adopted from statistics and machine learning, useful techniques for graph analysis and parallel programming, and the practical application of data science for such tasks as building recommender systems or performing sentiment analysis. Topics and features: provides numerous practical case studies using real-world data throughout the book; supports understanding through hands-on experience of solving data science problems using Python; describes techniques and tools for statistical analysis, machine learning, graph analysis, and parallel programming; reviews a range of applications of data science, including recommender systems and sentiment analysis of text data; provides supplementary code resources and data at an associated website.

Systematic Methods for Analyzing Culture H.J. François Dengah II,Jeffrey G. Snodgrass,Evan R. Polzer,William Cody Nixon,2020-12-29 Systematic Methods for Analyzing Culture is a practical manual that provides step-by-step instruction for collecting and analyzing cultural data. This compact guide explains complex topics in straightforward and practical terms, via research examples, textual and visual software guides, and hands-on exercises. Through each chapter's introductory examples, the manual illustrates how socially learned knowledge provides group members with shared understandings of the world, which allow for mutually intelligible interactions. The authors then carefully walk readers through the process of eliciting those socially learned, shared, and thus cultural representations of reality, which structure the thinking and practice of individuals inhabiting social groups. Specifically, the book shows how researchers can elicit such thought and behavior via

methods such as free lists, pile sorts, cultural consensus and consonance analysis, textual analysis, and personal network research. The book will help both undergraduate and graduate students identify ways to unpack the black box of culture, which may be absent or given only cursory attention within their training and respective fields. The book's clear and systematic step-by-step walkthroughs of each method will also encourage more established researchers, educators, and practitioners—from diverse fields and with varying levels of experience—to integrate techniques for assessing cultural processes into their research, teaching, and practice.

Social Network Analysis for Ego-Nets Nick Crossley,Elisa Bellotti,Gemma Edwards,Martin G Everett,Johan Koskinen,Mark Tranmer,2015-07-27 The ego-net approach to social network analysis, which takes discrete individual actors and their contacts as its starting point, is one of the most widely used approaches in the field. This is the first textbook to take readers through each stage of ego-net research, from conception, through research design and data gathering to analysis. It starts with the basics, assuming no prior knowledge of social network analysis, but then moves on to introduce cutting edge innovations, covering both new statistical approaches to ego-net analysis and also the most recent thinking on mixing methods (quantitative and qualitative) to achieve depth and rigour. Disaster Forensics Anthony J. Masys,2016-09-03 This book aims to uncover the root causes of natural and man-made disasters by going beyond the typical reports and case studies conducted post-disaster. It opens the black box of disasters by presenting 'forensic analysis approaches' to disasters, thereby revealing the complex causality that characterizes them and explaining how and why hazards do, or do not, become disasters. This yields 'systemic' strategies for managing disasters. Recently the global threat landscape has seen the emergence of high impact, low probability events. Events like Hurricane Katrina, the Great Japan Earthquake and tsunami, Hurricane Sandy, Super Typhoon Haiyan, global terrorist activities have become the new norm. Extreme events challenge our understanding regarding the interdependencies and complexity of the disaster aetiology and are often referred to as Black Swans. Between 2002 and 2011, there were 4130 disasters recorded that resulted from natural hazards around the world. In these, 1,117,527 people perished and a minimum of US$1,195 billion in losses were reported. In the year 2011 alone, 302 disasters claimed 29,782 lives; affected 206 million people and inflicted damages worth a minimum of estimated US$366 billion.

Advanced Information Networking and Applications Leonard Barolli,Flora Amato,Francesco Moscato,Tomoya Enokido,Makoto Takizawa,2020-03-27 This proceedings book covers the theory, design and applications of computer networks, distributed computing and information systems. Today's networks are evolving rapidly, and there are several developing areas and applications. These include heterogeneous networking supported by recent technological advances in power wireless communications, along with silicon integration of various functionalities such as sensing, communications, intelligence and actuations, which is emerging as a critically important disruptive computer class based on a new platform, networking structure and interface that enables novel, low-cost and high-volume applications. However, implemeting these applications has sometimes been difficult due to interconnection problems. As such, different networks need to collaborate, and wired and next-generation wireless systems need to be integrated in order to develop high-performance computing solutions to address the problems arising from these networks' complexities. This ebook presents the latest research findings, as well as theoretical and practical perspectives on the innovative methods and development techniques related to the emerging areas of information networking and applications

The Influence of Technology on Social Network Analysis and Mining Tansel Özyer,Jon Rokne,Gerhard Wagner,Arno H.P. Reuser,2013-03-15 The study of social networks was originated in social and business communities. In recent years, social network research has advanced significantly; the development of sophisticated techniques for Social Network Analysis and Mining (SNAM) has been highly influenced by the online social Web sites, email logs, phone logs and instant messaging systems, which are widely analyzed using graph theory and machine learning techniques. People perceive the Web increasingly as a social medium that fosters interaction among people, sharing of experiences and knowledge, group activities, community formation and evolution. This has led to a rising prominence of SNAM in academia, politics, homeland security and business. This follows the pattern of known entities of our society that have evolved into networks in which actors are increasingly dependent on their structural embedding General areas of interest to the book include information science and mathematics, communication studies, business and organizational studies, sociology, psychology, anthropology, applied linguistics, biology and medicine.
